

INTELLIGENT LIFE SYSTEM

2022

THE MAJOR PROBLEMS IN THE
WORLD ARE THE RESULT OF THE
DIFFERENCE BETWEEN HOW
NATURE WORKS AND THE WAY
PEOPLE THINK.

GREGORY BATESON

Our individual, organisational and societal approach to progress is not based on a understanding of how life really works, and therefore cannot identify the real root of the issues we face every day, or offer a viable solution.

How do we meet this disconnection?

In recent times we see attempts at a new kind of action, bringing leaders together to discuss alternative solutions. However, what is lacking at the moment is an ontological view: a view into the mechanics of all systems and how they affect the way we run every aspect of life, including how we make individual choices, do business, make provision for citizens and interact with the planet and earthly 'resources'.

Individuals, organisations and society can, and must, redefine their responsibilities and terms of success. It takes more than concerted action to ensure human activity becomes a driving force for social, environmental and economic benefit. Concerted action alone will not solve these complex problems.

System theory is the first meta-theoretical approach that has tried to deliver a new, integrated understanding. And yet, after 40 years of systems theory, we are still living with multiple system stressors.

Is it possible to 'cure' one system without depleting another?

We need to use the highest possible abstraction levels in systems thinking... going to the 'source'.

It is only through an understanding of the meta system that we can develop truly new solutions, breakthrough approaches and not simply recycle old ideas within existing frameworks.

We are gradually realising that to achieve this, individually and collectively, we need to fundamentally re-evaluate our existing approach.

Yet, the knowledge of how life really works, of what's required to produce personal satisfaction, let alone an enduringly successful organisation a highly functioning society or a sane and healthy world, has remained frustratingly elusive.

What if we are currently trying to make things work without understanding the underlying mechanics?

What if these hidden mechanics were a crucial influence in the results we are getting?

And what if our continued misunderstanding was responsible for the increased challenges we are now facing?

We need a whole new understanding to go any further. The kind of understanding that goes beyond the limited capacity of any singular discipline. The kind of understanding that can change the future we are heading towards.

Natural intelligence is a new Meta theory that is just emerging, that aims to address some of the pressing issues of our time.

The laws of existence offer us a fascinating insight into the underlying mechanics of life. They give us a fractal hypothesis that scales across the individual to global spectrum.

What if the mechanics that successfully create and sustain life on earth, are the clues for how to better run our lives, organisations and society?

There is an underlying design to life that has remained unexamined in our search for answers, despite being predisposed towards order and harmony. It is beyond cultural, geographical, historical, societal and educational considerations.

It can be tracked, explored and understood by everyone. As such it is the only system in operation that is truly universal.

Everything works off this central design of natural intelligence, whether we realise it or not. And it acts as the foundation template and unifying property for all life.

For human beings, it applies to every aspect of life – self-understanding, relationships, health, finances, business – right up to international relations and the ecology of the planet.

When we examine the innate properties we can see that life is predisposed to bring us not only contentment, but also satisfaction, growth and success. It is also designed for peace amongst nations and the health of our planet.

We are a be-think-do platform that trains individuals and organisations in the concept, practice and application of natural intelligence.

Used as a framework across the human, organisational and societal spectrum, it provides a nutrient-rich medium for the co-creation of new outcomes.

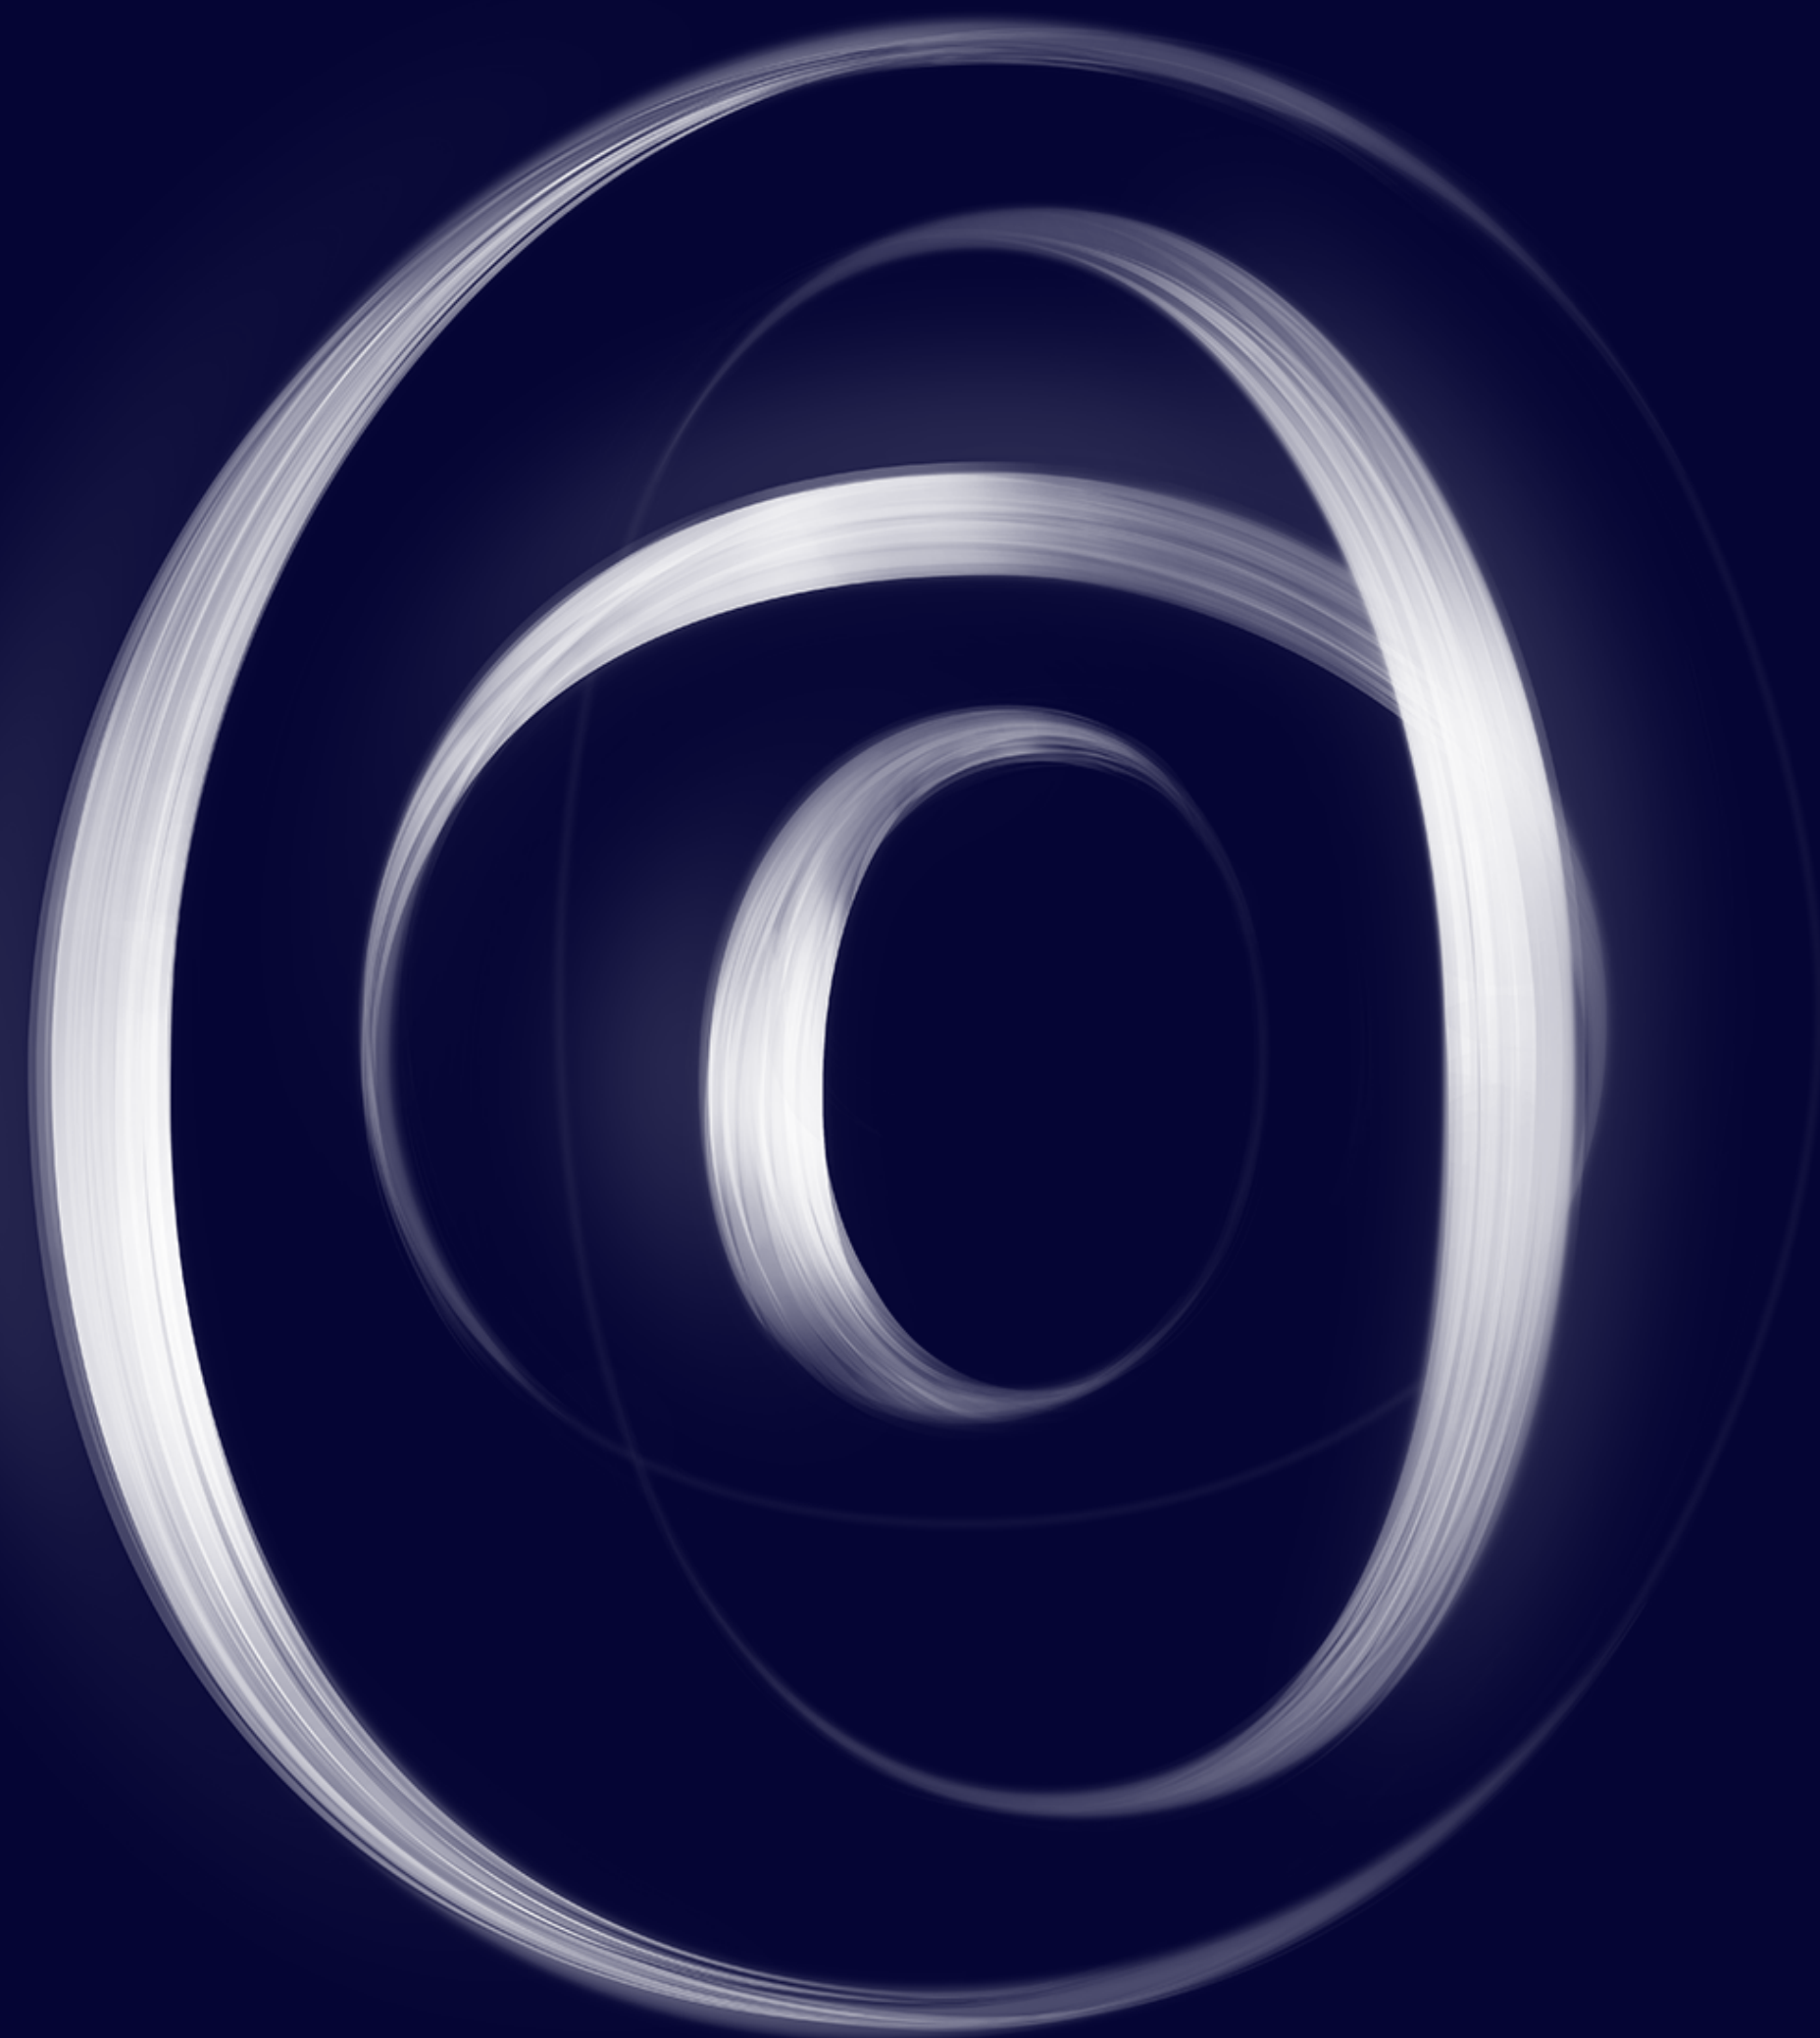

The vision we bring is to create a world where we live life from a deep understanding of the operating system of humanity, and see practical solutions to implement this knowledge into our own lives, our organisations and scale this into our societies to bring planet-wide benefits.

Our work moves beyond the current approach of using a separate discipline for each issue.

We offer a unified framework; an operating system for humans that acts like a stem cell injection, one that recalibrates the whole organism.

It changes the entire landscape of our attempts to create workable solutions, and in doing so, gives us the possibility of completely new outcomes for the challenges we face every single day as a species.

That's what we'd like to share with you.
